Crane Fluid Systems' controls healthcare heating

**Crane Fluid Systems has supplied Pro-balance bronze balancing valves to control heating, ventilation, and cooled water flow at a health facility.**

Pro-balance valves have been installed at the Brierley Hill Health and Social Care Centre as part of a low energy MandE package at the new build project.

More than 1,200 valve units will control the heating and water flow through fan coil units within the five-storey building.

In terms of ventilation, half of the building employs natural ventilation while the other half faces a busy road where natural air flow was not a suitable option, and utilises traditional HVAC systems.

Pro-balance valves feature integrated orifice ensuring a compact design and fast installation with minimal requirement for on-site jointing.
